

AMENDMENTS TO THE SPECIFICATION

Please replace ¶ [0020] with the following:

[0020] The aforementioned assembly greatly improves over the prior art. Not only does the assembly provide for automatic connection of the electrical connection for the ~~cooling~~ cooling fan 10, it provides for a plurality of other related benefits. Significantly, the assembly can prevent the production downtime which previously occurred when it was discovered that electrical connections for the cooling fans were not being systematically made. Second, as a result of the fixed connection, there is a greatly reduced risk that the electrical connection will subsequently be undone, even during periods when the CPU is being transported. Finally, the EMI performance of the CPU design is enhanced due to the shortness of the length of the conductor 34 which, in turn, reduces electromagnetic emissions. Moreover, the generally straight orientation of the conductor 34 prevents the creation of induction which might otherwise occur if the conductor were in the form of a coil.
